Queensland Government Shares Location Intelligence Across the Enterprise

The Queensland Government has implemented ESRI server GIS technology at an enterprise level, making the technology available to all users of GovNet, the Queensland Government's intranet site.

The server-based technology allows all staff members from Queensland Government to access the Information Queensland (IQ) online atlas through a map viewer.

The IQ atlas provides the whole of Queensland Government with a new and innovative way to locate and access government-held information on land, resources, demographics and statistical information, as well as satellite imagery, topography, property and land use information. This information is layered, and spatially presented over a map of Queensland, allowing users to zoom and pan maps of the state to view and explore details online.

"Through using this web-based technology, Queensland Government agencies will gain access to the latest mapping tools and data and be able to provide similar mapping functionality for their applications", said Gary Shaw, Director of Information Queensland.

Government agencies will also be able to build and present web mapping applications for the community using the Internet. This means that a consistent user experience will be achieved in all interactions between the community and agencies irrespective of the department providing the information.

"I am thrilled that our company is involved in delivering location intelligence across Queensland Government. It is an important step forward in further developing the partnership between the Queensland Government and local industry," said Brett Bundock, Managing Director, ESRI Australia.
